

LIFE EUROKITE CRIME REPORT

ILLEGAL PERSECUTION OF TAGGED RED KITES AND OTHER RAPTOR SPECIES IN EUROPE

PART 18 - COUNTRY SPECIFIC RESULTS - SPAIN

First interim report on the results of the LIFE EUROKITE (LIFE18 NAT/AT/000048) project 2020-2024 with additional results from 2013 onwards

"Cross-border protection of the red kite in Europe by reducing human-caused mortality"

This company project report was compiled by TB Raab GmbH within the LIFE EUROKITE project (LIFE18 NAT/AT/000048) and was checked by the owner of the loggers and the representatives of the (cooperation) partners responsible for finding the dead birds.

Structure of the Crime Report

Due to the size of the report, it is divided in the following parts. Please see the other report parts for further information.

Part 1 - Introduction, Methods, Overall Results, Discussion, Conclusion & Recommendation

Part 2 - Country specific results - Austria

Part 3 - Country specific results - Belgium

Part 4 - Country specific results - Croatia

Part 5 - Country specific results - Czech Republic

Part 6 - Country specific results - Denmark

Part 7 - Country specific results - France

Part 8 - Country specific results - Germany

Part 9 - Country specific results - Greece

Part 10 - Country specific results - Hungary

Part 11 - Country specific results - Italy

Part 12 - Country specific results - Luxembourg

Part 13 - Country specific results - Netherlands

Part 14 - Country specific results - Poland

Part 15 - Country specific results - Portugal

Part 16 - Country specific results - Serbia

Part 17 - Country specific results - Slovakia

Part 18 - Country specific results - Spain

Part 19 - Country specific results - Switzerland

Part 20 - Country specific results - Turkey

Part 21 - Country specific results - Other countries outside Europe

1 Summary

The LIFE EUROKITE project (LIFE18 NAT/AT/000048) is a cross-border protection project for the red kite and other raptor species in Europe. Within the LIFE EUROKITE project the core idea is to use telemetry technology to identify the spatial habitat use of the target raptor species, quantify the key reasons of mortality of bird of prey species in the EU and reduce human-caused mortality, particularly illegal activities such as poisoning.

Between 2013 and 2024, 3,554 individuals of 7 raptor species (3,161 red kites, 97 black kites, 43 booted eagles, 52 honey buzzards, 79 imperial eagles, 22 ospreys and 100 white-tailed eagles) were tagged with solar-powered GPS satellite tags in 19 countries across Europe with the help of many project partners and cooperation partners. From this a total of 1,795 individuals (1,680 red kites, 37 black kites, 18 honey buzzards, 29 imperial eagles and 31 white-tailed eagles) were tagged within the LIFE EUROKITE project.

From the 3,554 tagged birds a total of 1,623 died so far. Of these, a total of 1,594 individuals (1,480 red kites, 13 black kites, 14 booted eagles, 17 honey buzzards, 32 imperial eagles, 8 ospreys, 30 white-tailed eagles) died in the respective country where we also detected bird persecution within our sample. The first results of the LIFE EUROKITE project show, that 320 (20.08 %) of the tagged birds (293; 19.80 % red kites, 3; 23.08 % black kites, 1; 7.14 % booted eagles, 2; 11.76 % honey buzzards, 12; 37.50 % imperial eagles, 1; 12.50 % ospreys, 8; 26.67 % white-tailed eagles) were victims of illegal activities in 24 countries (10/01/2025). Poisoning (n= 238; 74.38 % of illegal activities) was by far the most common illegal act that caused the death of these tagged birds. The most used poison was Carbofuran which is banned in the EU since 2008. The second most common illegal act that caused the death of these tagged birds was shooting (66 individuals; 20.63 % of illegal activities). Of the 320 birds that were tagged and illegally killed, only 8 cases resulted in a conviction for bird persecution.

When extrapolating the data on illegal bird persecution over the past five years (2020–2024), it is estimated that approximately 46.180 red kites have died as a result of persecution. This estimate is derived by scaling up known persecution rates of tagged birds to the entire European red kite population, based on published population size estimates, average annual mortality rates, and the proportion of mortality attributed to illegal killing. It therefore reflects a population-level extrapolation, not a direct count of detected cases.

Due to varying numbers of tagged individuals and differing red kite population densities across countries, the results may vary considerably. Consequently, these findings do not allow for conclusions regarding the statistical frequency of illegal activities relative to red kite density in any given country.

Bird persecution in Europe persists all over Europe. Effective conservation requires stronger law enforcement, public education, international cooperation, and better tools like GPS tracking to detect and prosecute offenders. Political commitment across countries is crucial, along with harmonized laws, stricter penalties, and national action plans with clear goals. Raising awareness through initiatives like the “European Day Against Criminal Poisoning of Wildlife” and systematic data collection can help inform both the public and policymakers. Finally, stronger cross-border collaboration and support for monitoring and reporting systems are essential to address bird persecution at a European level.

2 Introduction

The LIFE EUROKITE project (LIFE18 NAT/AT/000048) is a cross-border protection project for the red kite and other raptor species in Europe. Within the LIFE EUROKITE project the core idea is to use telemetry technology to identify the spatial habitat use of the target raptor species, quantify the key reasons of mortality of bird of prey species in the EU and reduce human-caused mortality, particularly from illegal activities such as poisoning.

Specifically, the red kite (*Milvus milvus*) can act as an indicator of anthropogenic mortality across broad extents (Donázar et al. 2016; Natsukawa and Sergio, 2022) due to its high individual variability in migration strategies (García-Macía et al. 2022) and its condition of good sentinel species for main threats to raptors (Mattson et al. 2022). As migratory behaviour is associated with different exposure and risk levels, understanding the causes of cross-border mortality in red kites can provide important warning signs regarding wider impacts of human activities on wildlife populations in Europe (Donázar et al. 2016; Natsukawa and Sergio, 2022).

In response to ongoing illegal threats to migratory birds, international conservation bodies have taken major steps toward unified action. Under the leadership of the Convention on Migratory Species (CMS) and the Bern Convention, and with the involvement of numerous states, observers, and expert groups, a comprehensive framework was adopted: the *Rome Strategic Plan 2020–2030*. This plan outlines a joint commitment to halving illegal bird killings in Europe and the Mediterranean by 2030, using 2020 as a baseline (Council of Europe, 2019). By generating large-scale, cross-border evidence on mortality causes, the LIFE EUROKITE Crime Report plays a key role in tracking progress toward this ambitious objective.

The Article 12 of the Habitats Directive clearly defines that member states shall take requisite measures to establish a system of strict protection for the animal species listed in Annex IV(a) in their natural range, prohibiting, among others, all forms of deliberate capture or killing and shall establish a system to monitor the incidental capture and killing of specimens of these species in the wild (European Commission, 2021; Panter et al. under review).

Between 2013 and 2024, 3,554 individuals of 7 raptor species (3,161 red kites, 97 black kites, 43 booted eagles, 52 honey buzzards, 79 imperial eagles, 22 ospreys and 100 white-tailed eagles) were tagged with solar-powered GPS satellite tags in 19 countries across Europe with the help of many project partners and cooperation partners. From this a total of 1,795 individuals (1,680 red kites, 37 black kites, 18 honey buzzards, 29 imperial eagles and 31 white-tailed eagles) were tagged within the LIFE EUROKITE project (Figure 1 to Figure 7).

The first results of the LIFE EUROKITE project show that illegal persecution of tagged birds (shooting, poisoning, trapping) is one of the biggest threats for those species. To date (as of 10 January 2025), 320 tagged birds have been victims of bird crime (Figure 8).

This report will give an overview of tagged birds which died due to illegal activities in Spain and will give a detailed inside of the status of investigations and legal procedure.

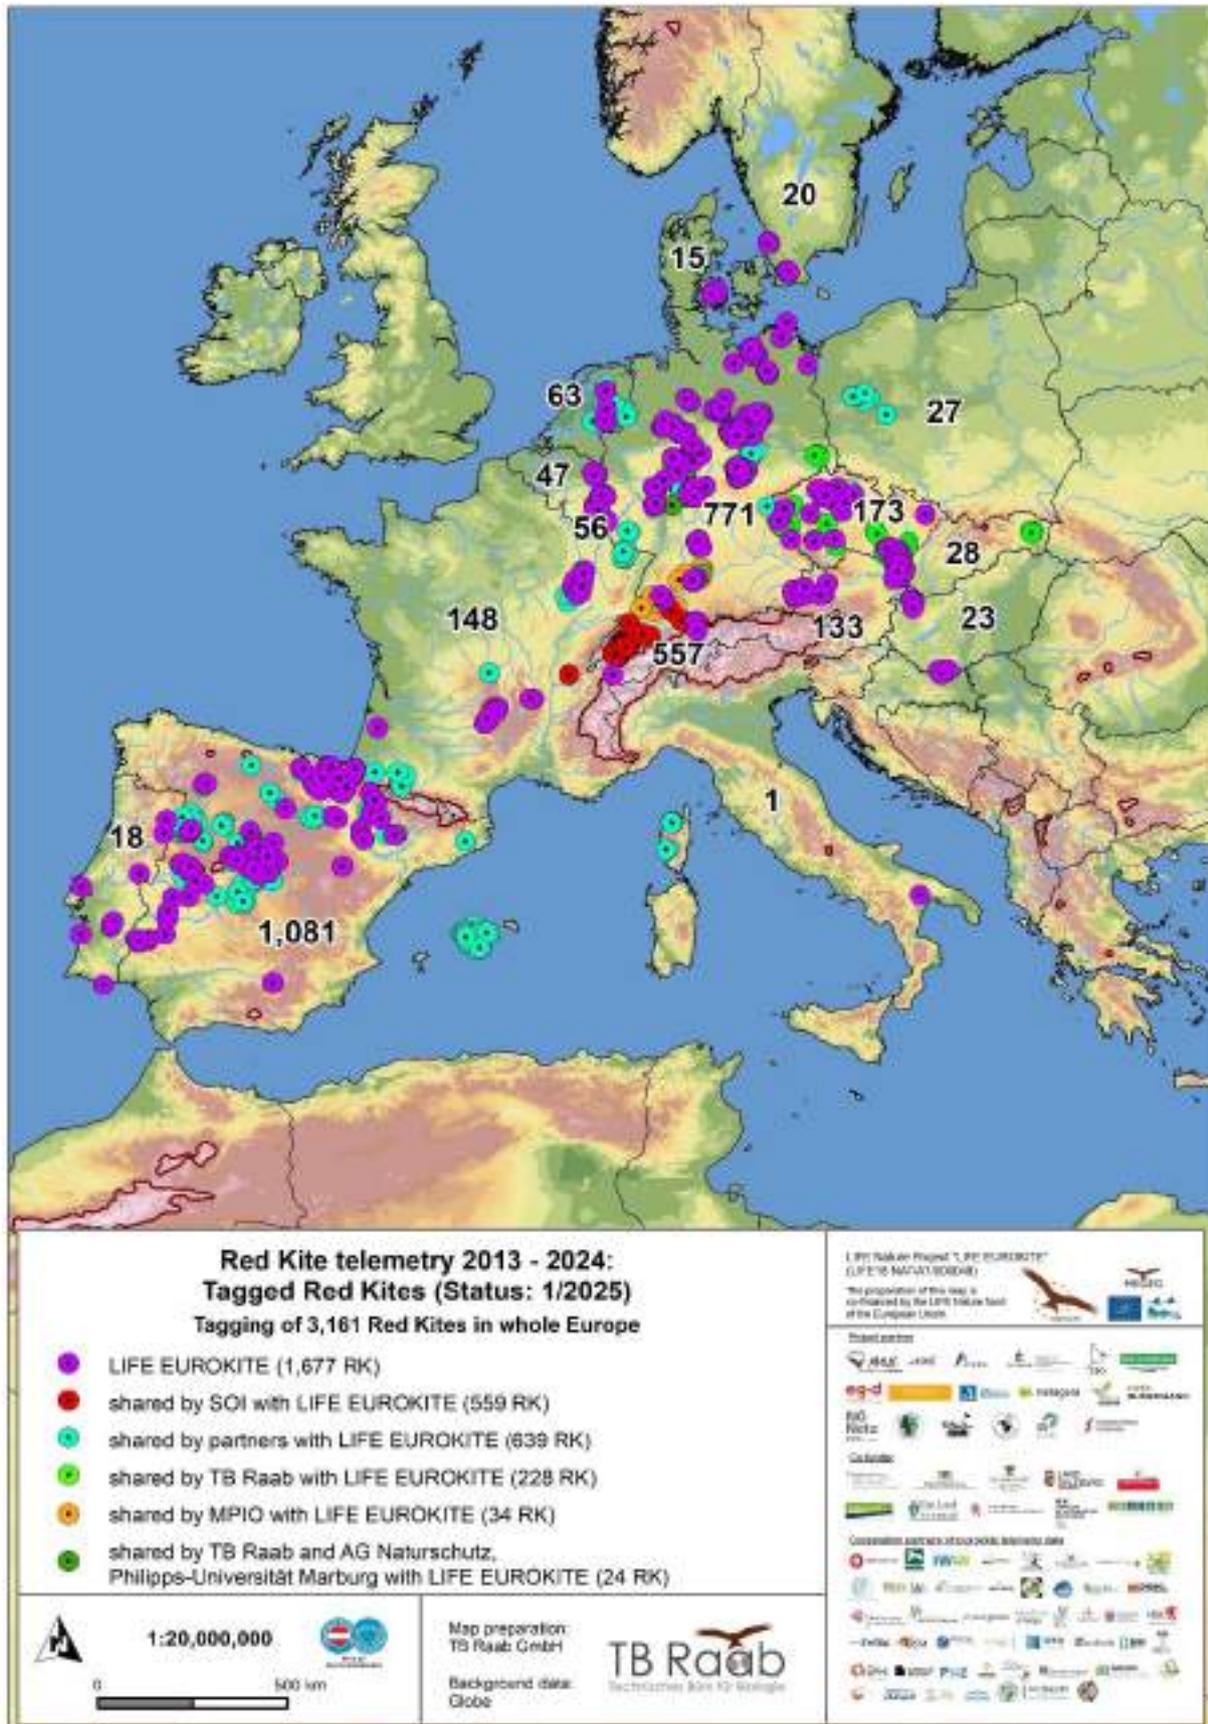

Figure 1: Tagging of 3,161 red kites by the LIFE EUROKITE project and numerous cooperation and project partners across Europe in the years 2013- 2024.

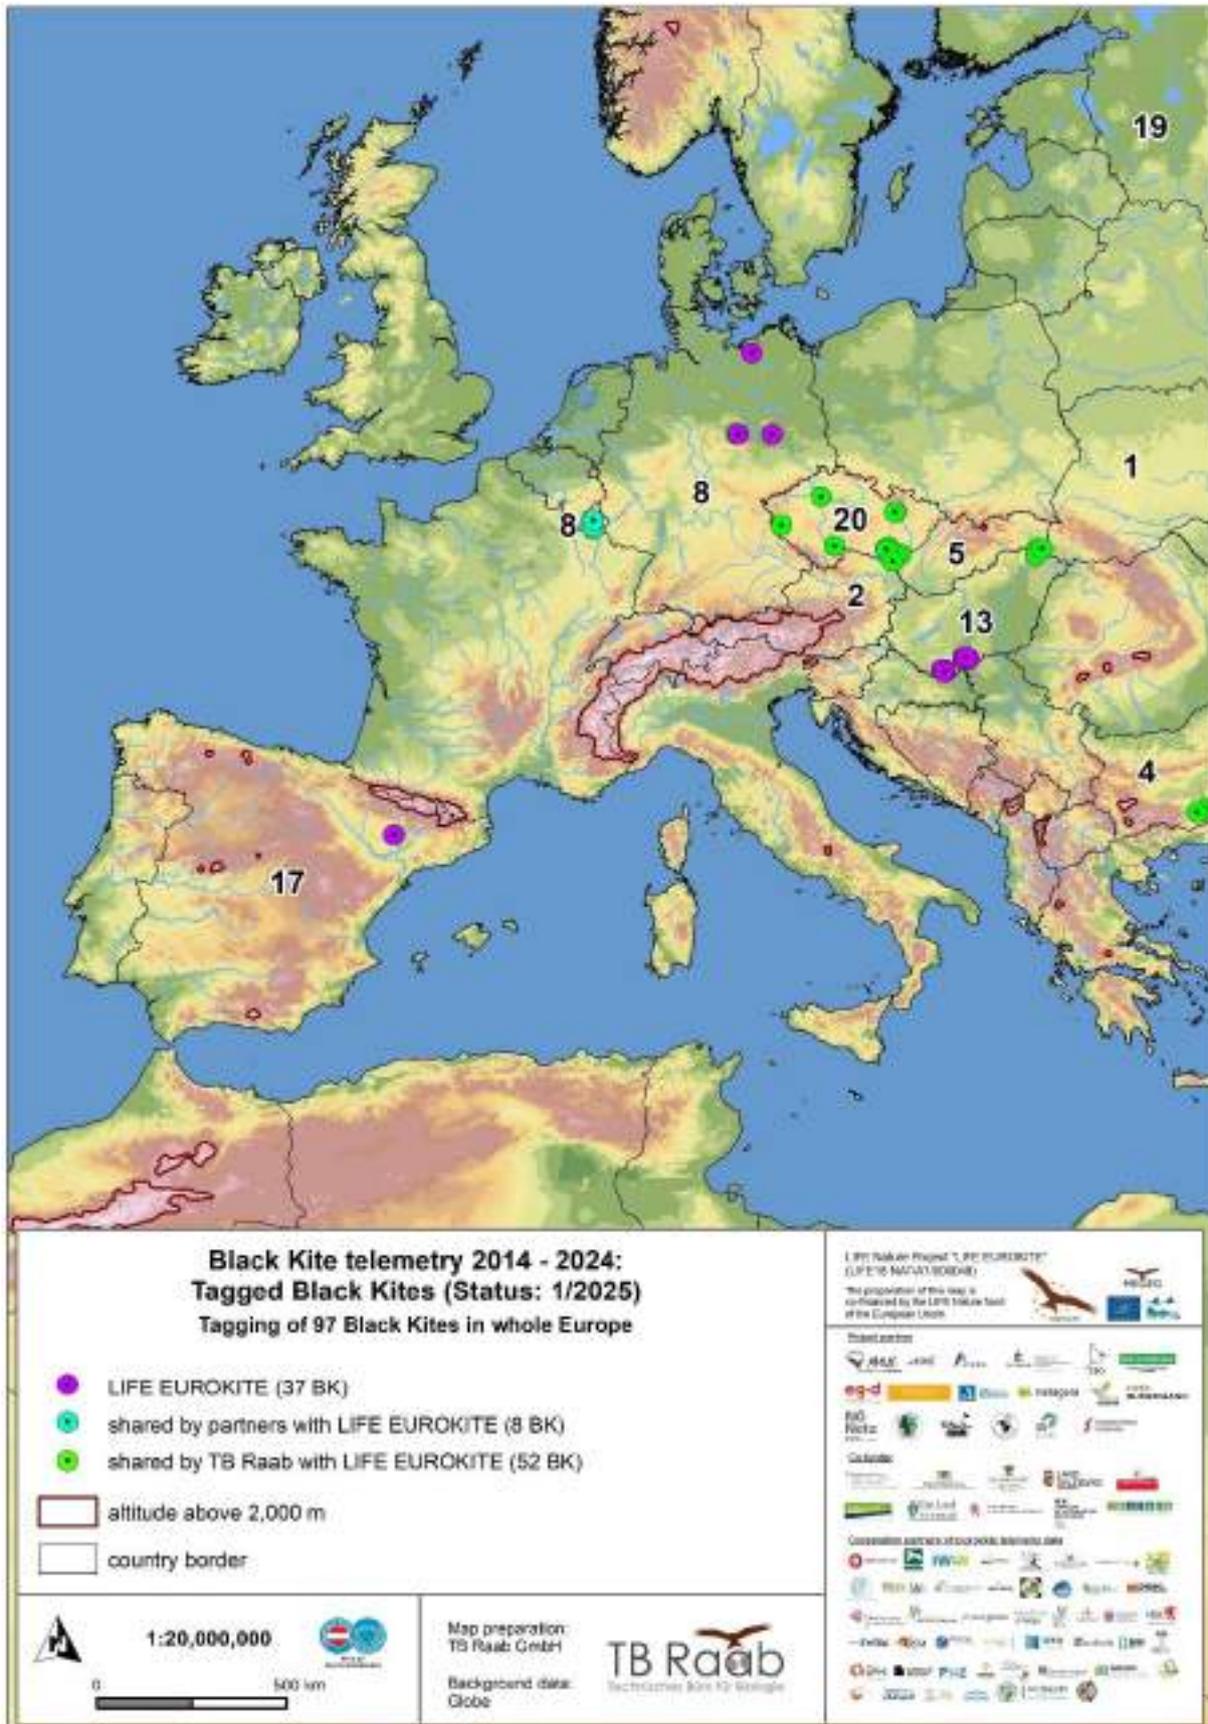

Figure 2: Tagging of 97 black kites by the LIFE EUROKITE project and numerous cooperation and project partners across Europe in the years 2014- 2024.

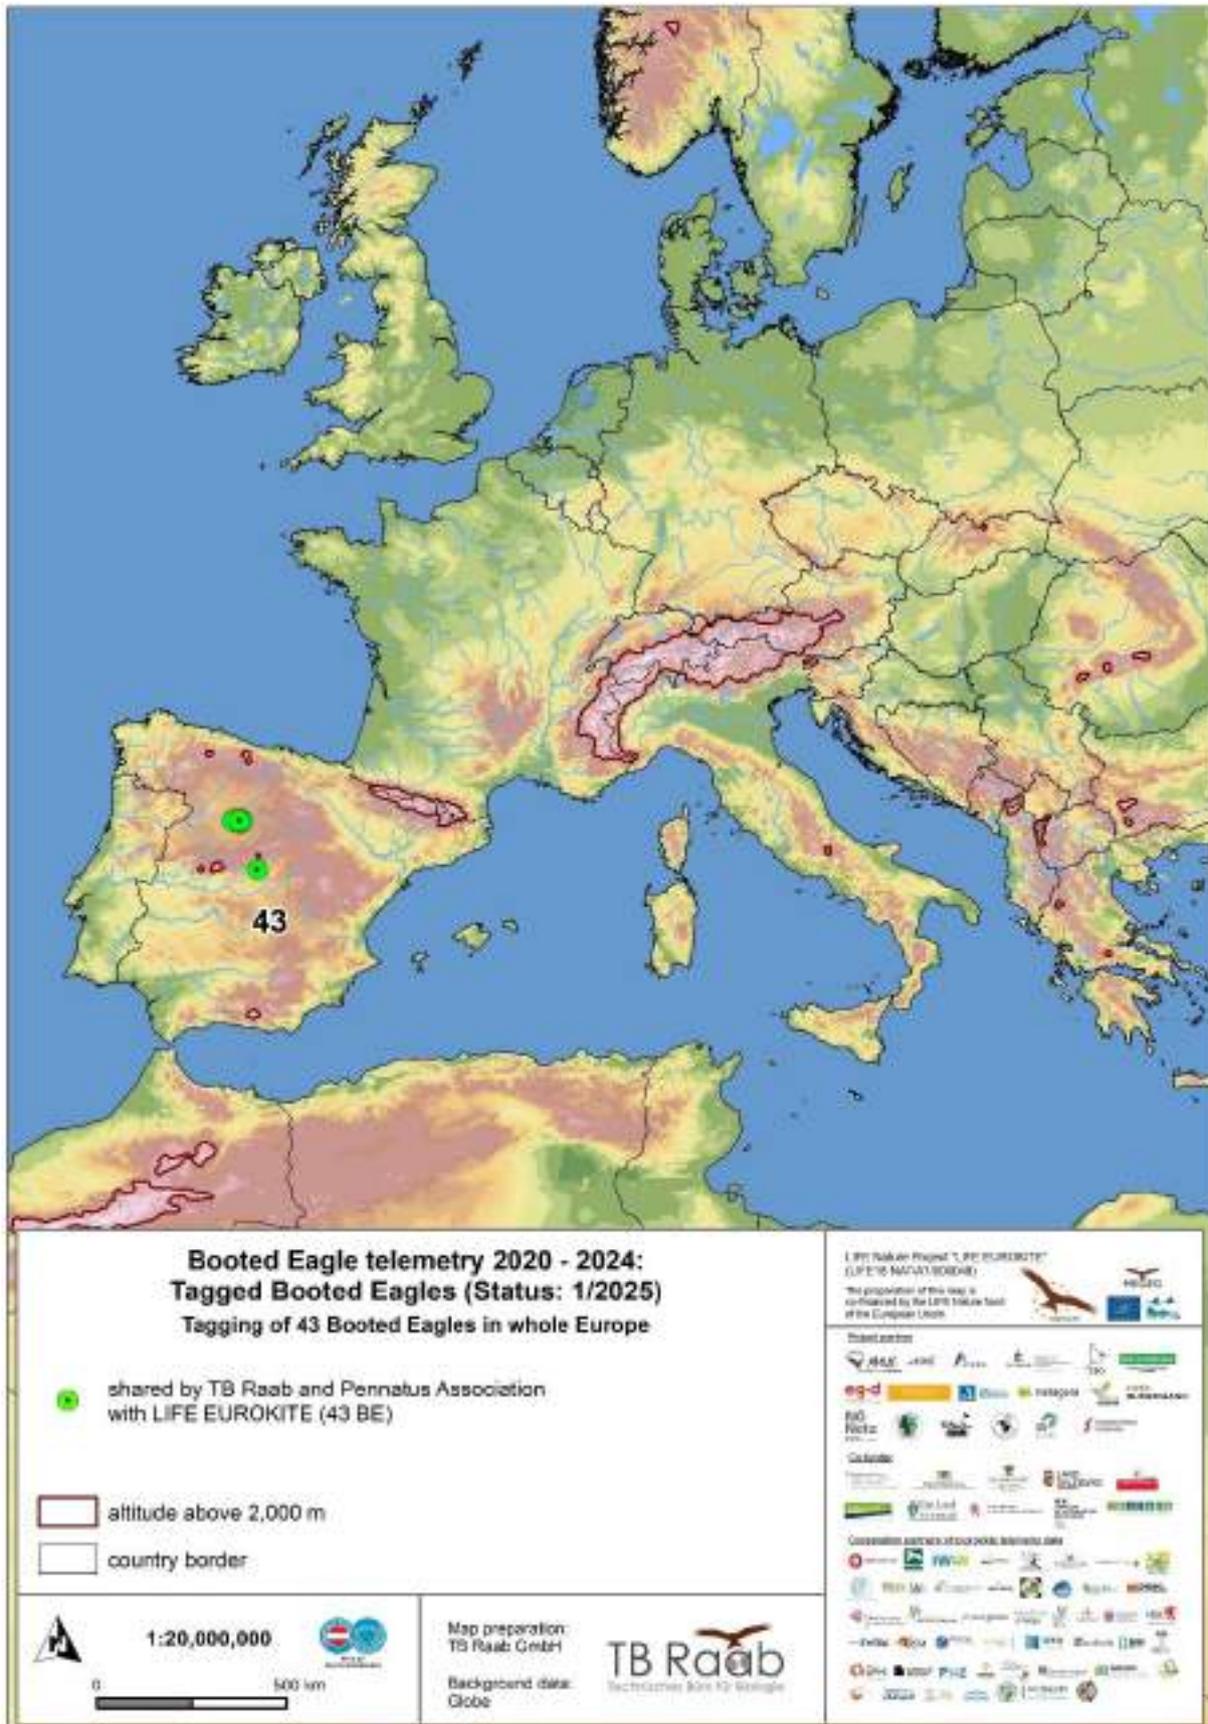

Figure 3: Tagging of 43 booted eagles by the LIFE EUROKITE project and numerous cooperation and project partners across Europe in the years 2020- 2024.

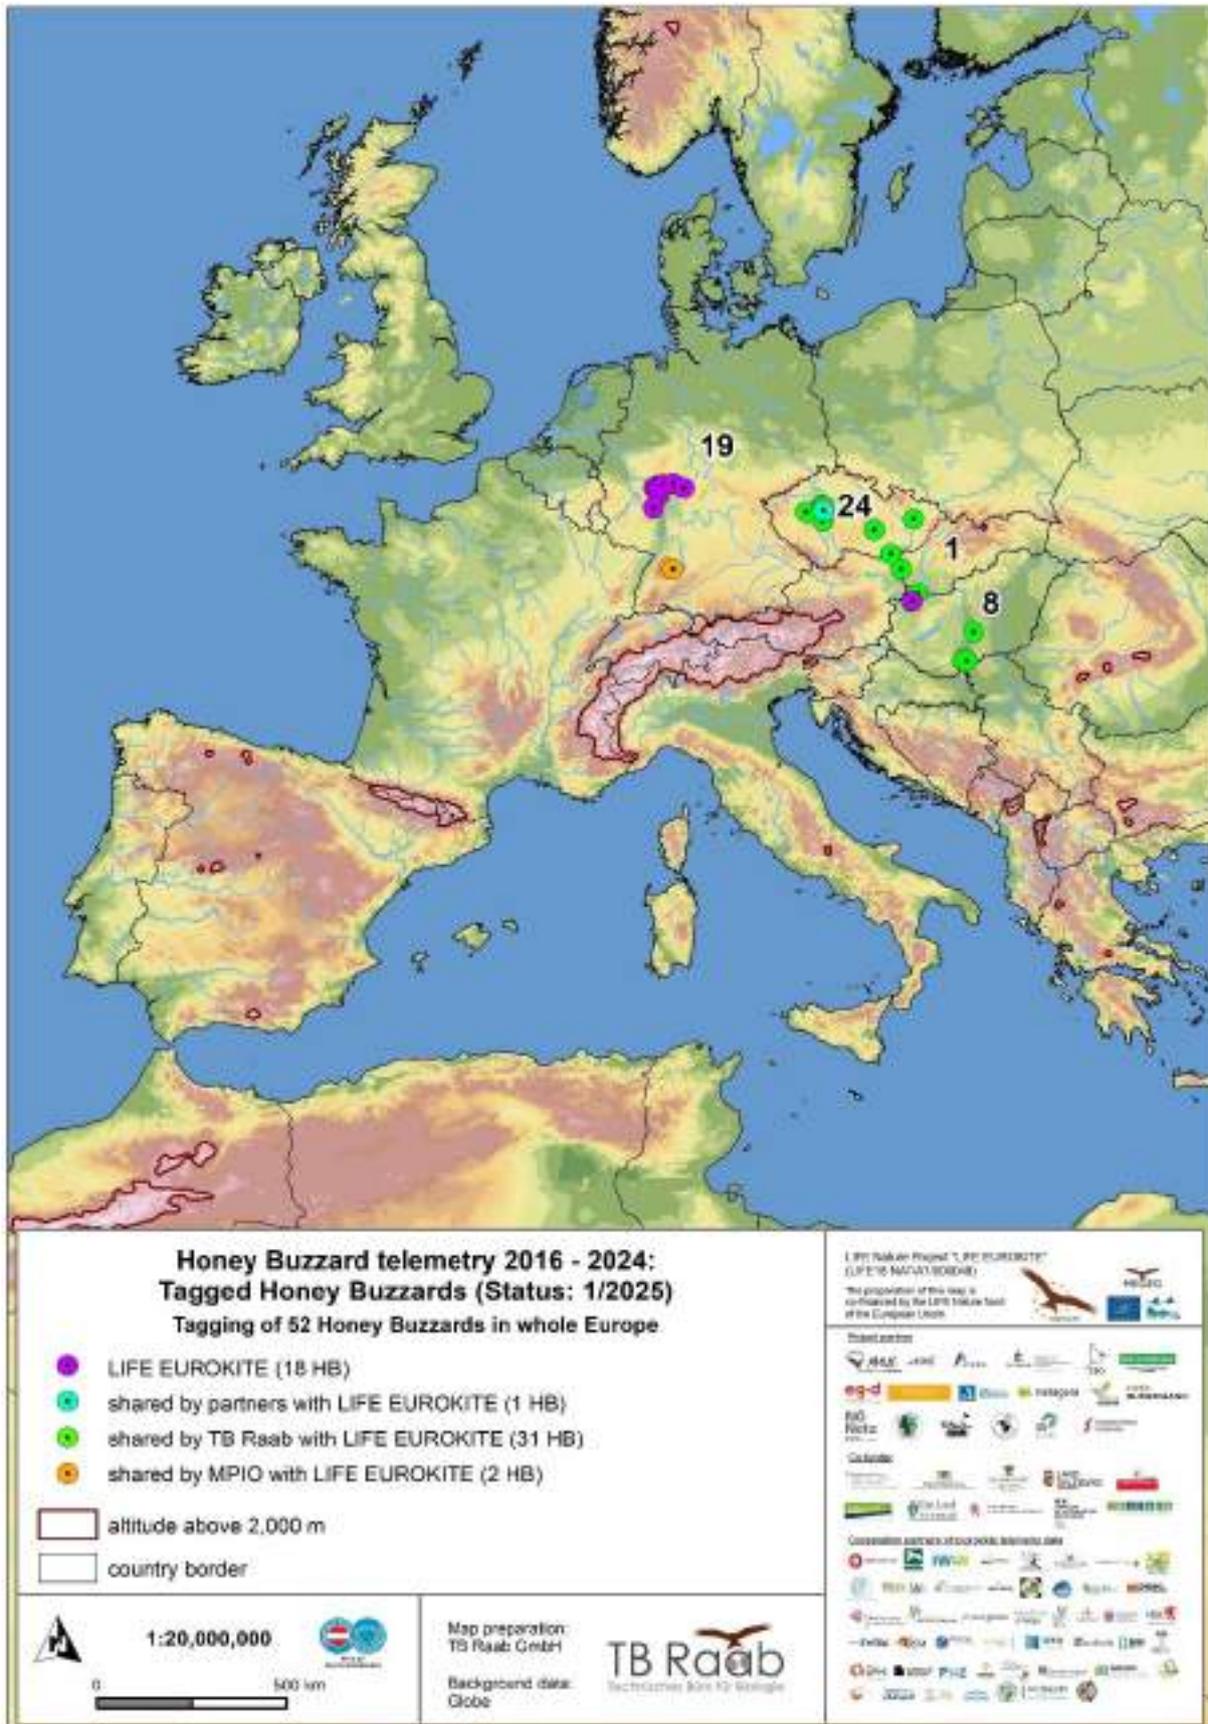

Figure 4: Tagging of 52 honey buzzards by the LIFE EUROKITE project and numerous cooperation and project partners across Europe in the years 2016-2024.

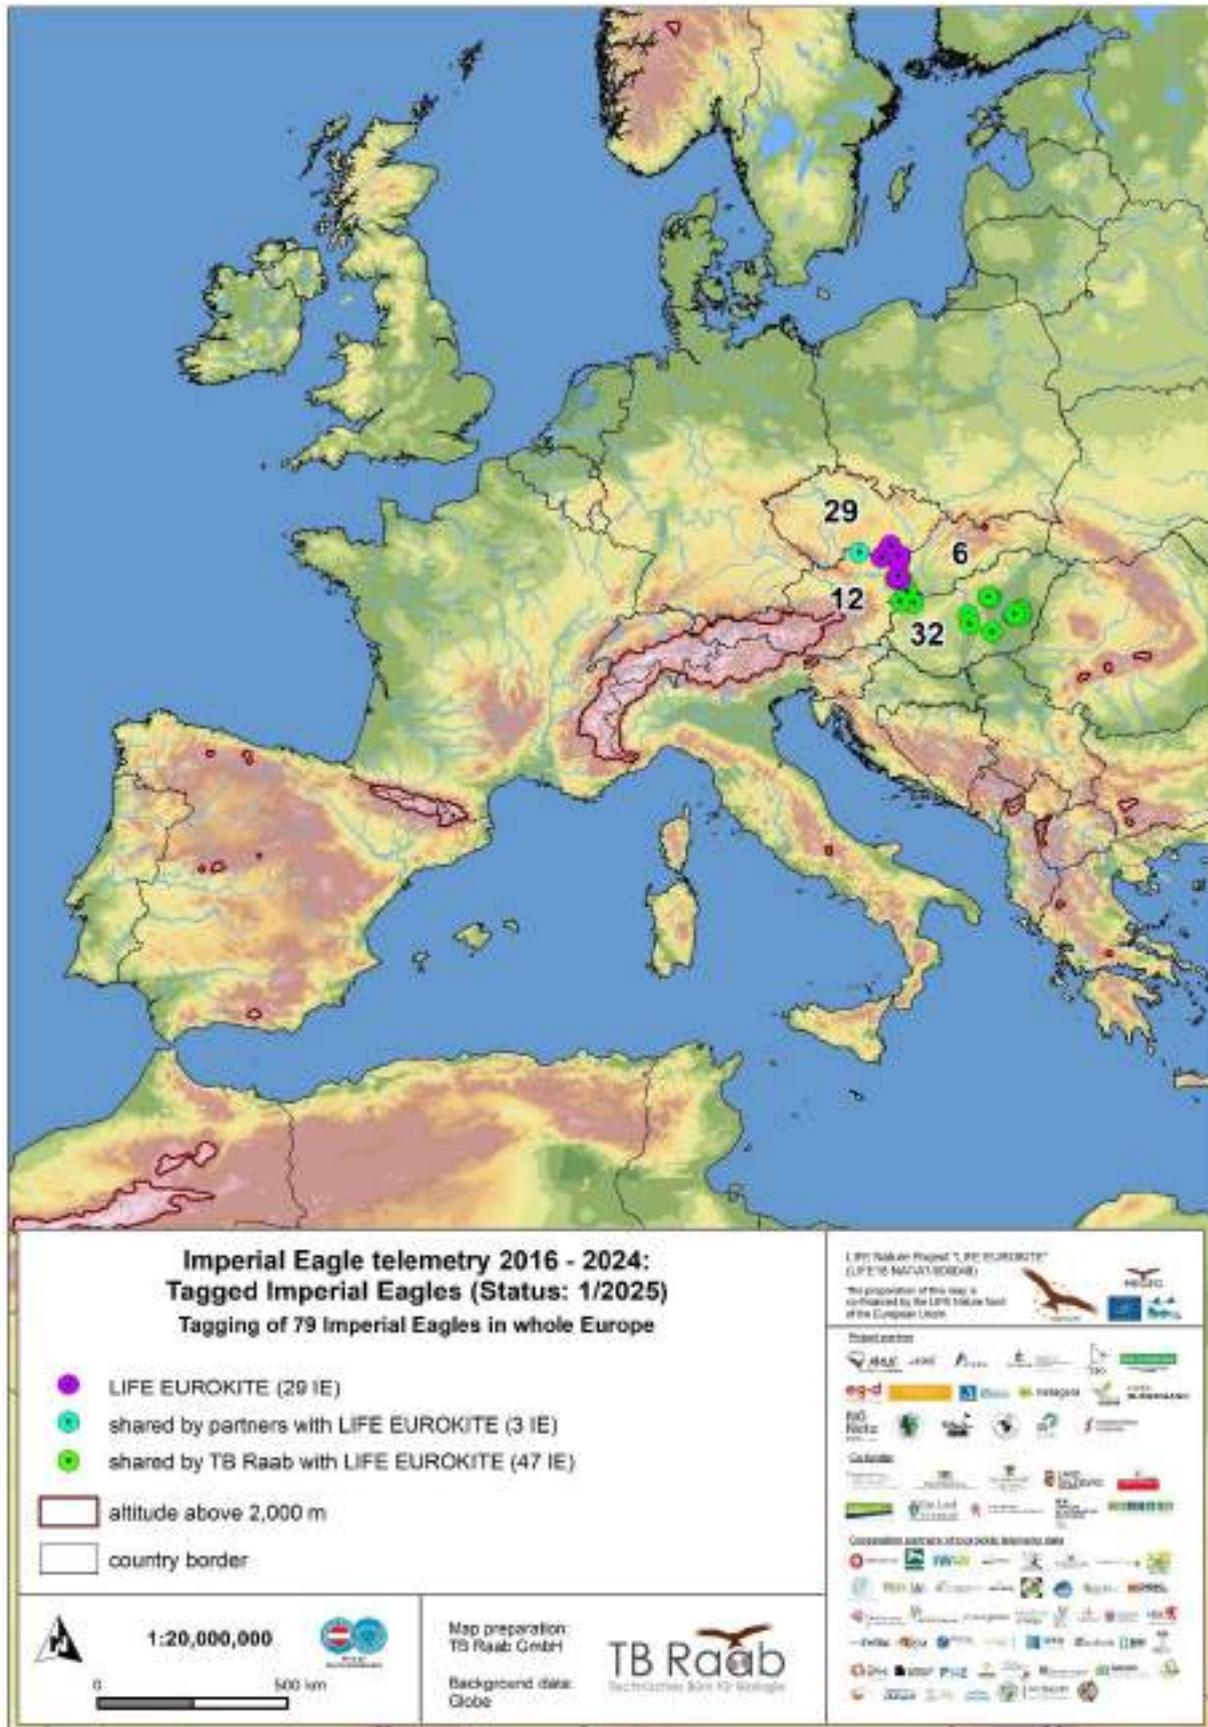

Figure 5: Tagging of 79 imperial eagles by the LIFE EUROKITE project and numerous cooperation and project partners across Europe the years 2016–2024.

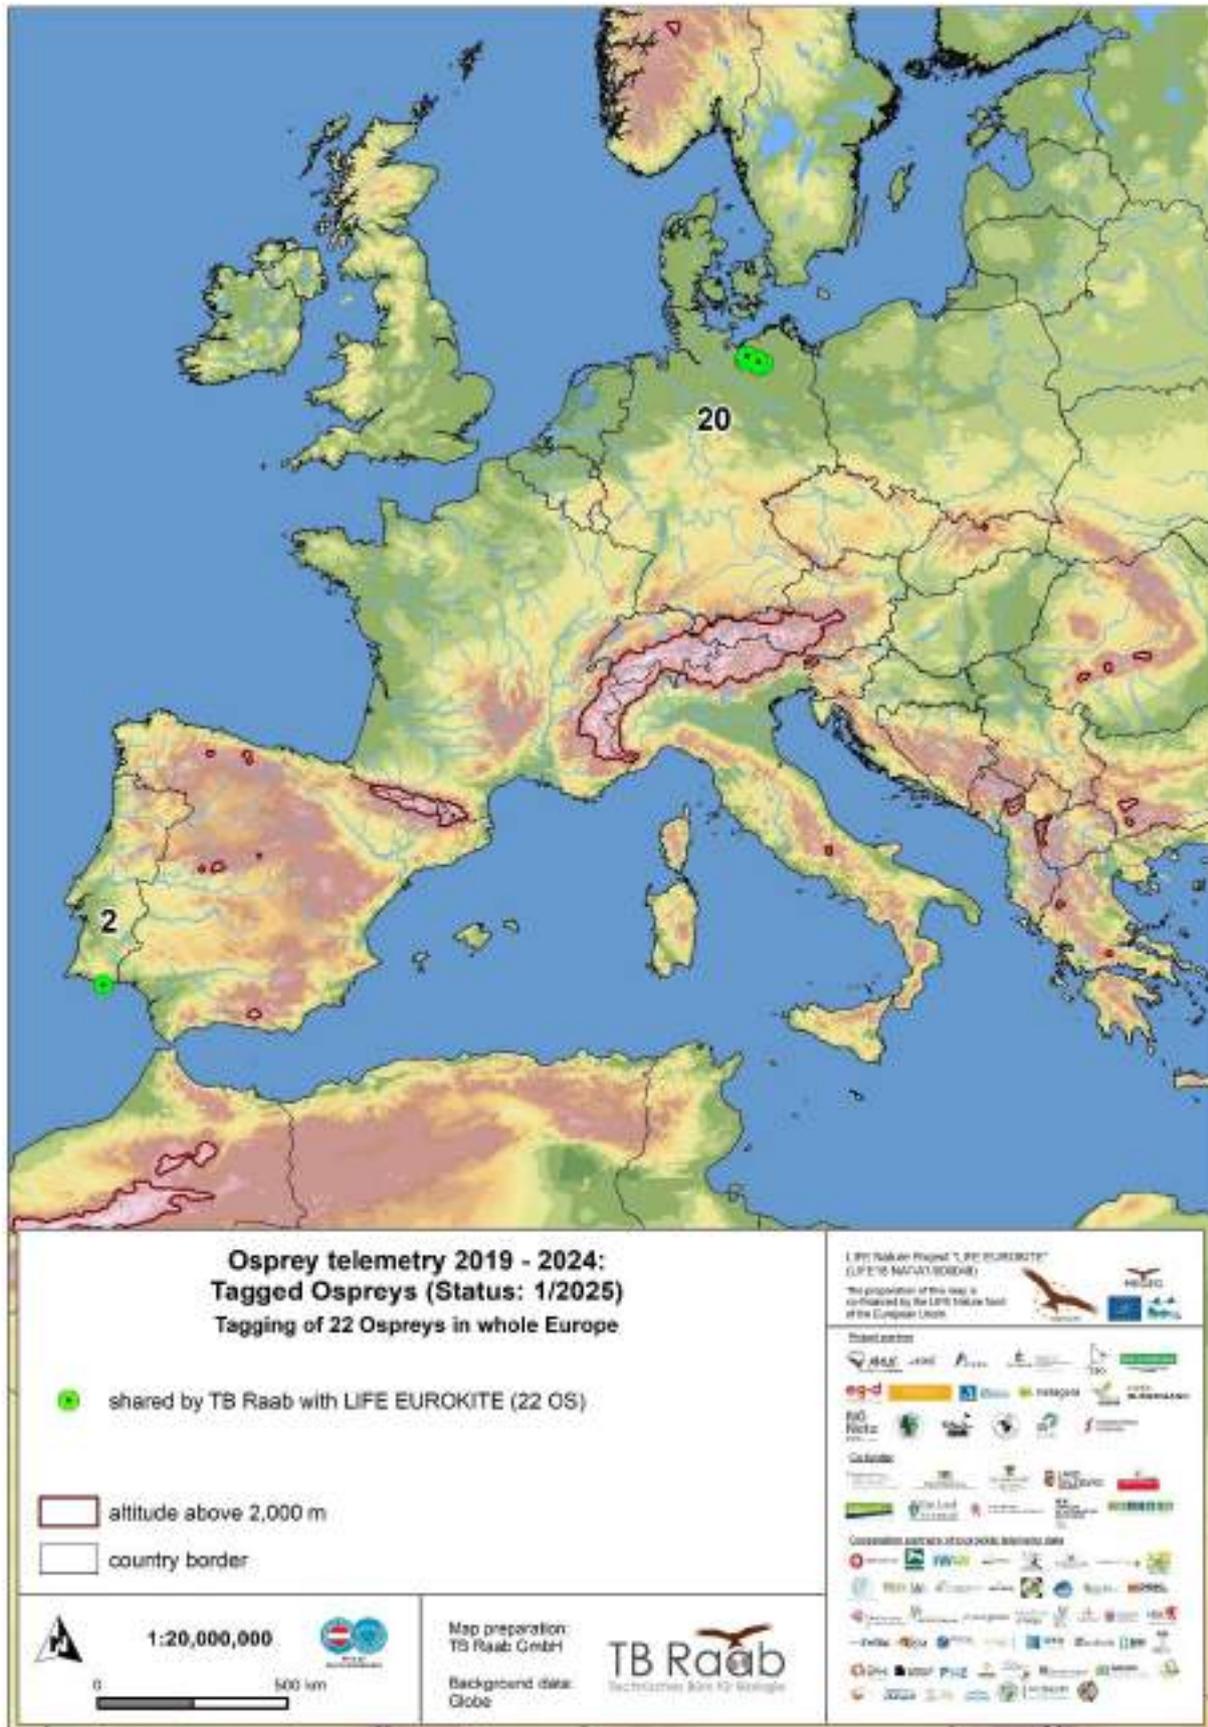

Figure 6: Tagging of 22 ospreys by the LIFE EUROKITE project and numerous cooperation and project partners across Europe the years 2019-2024.

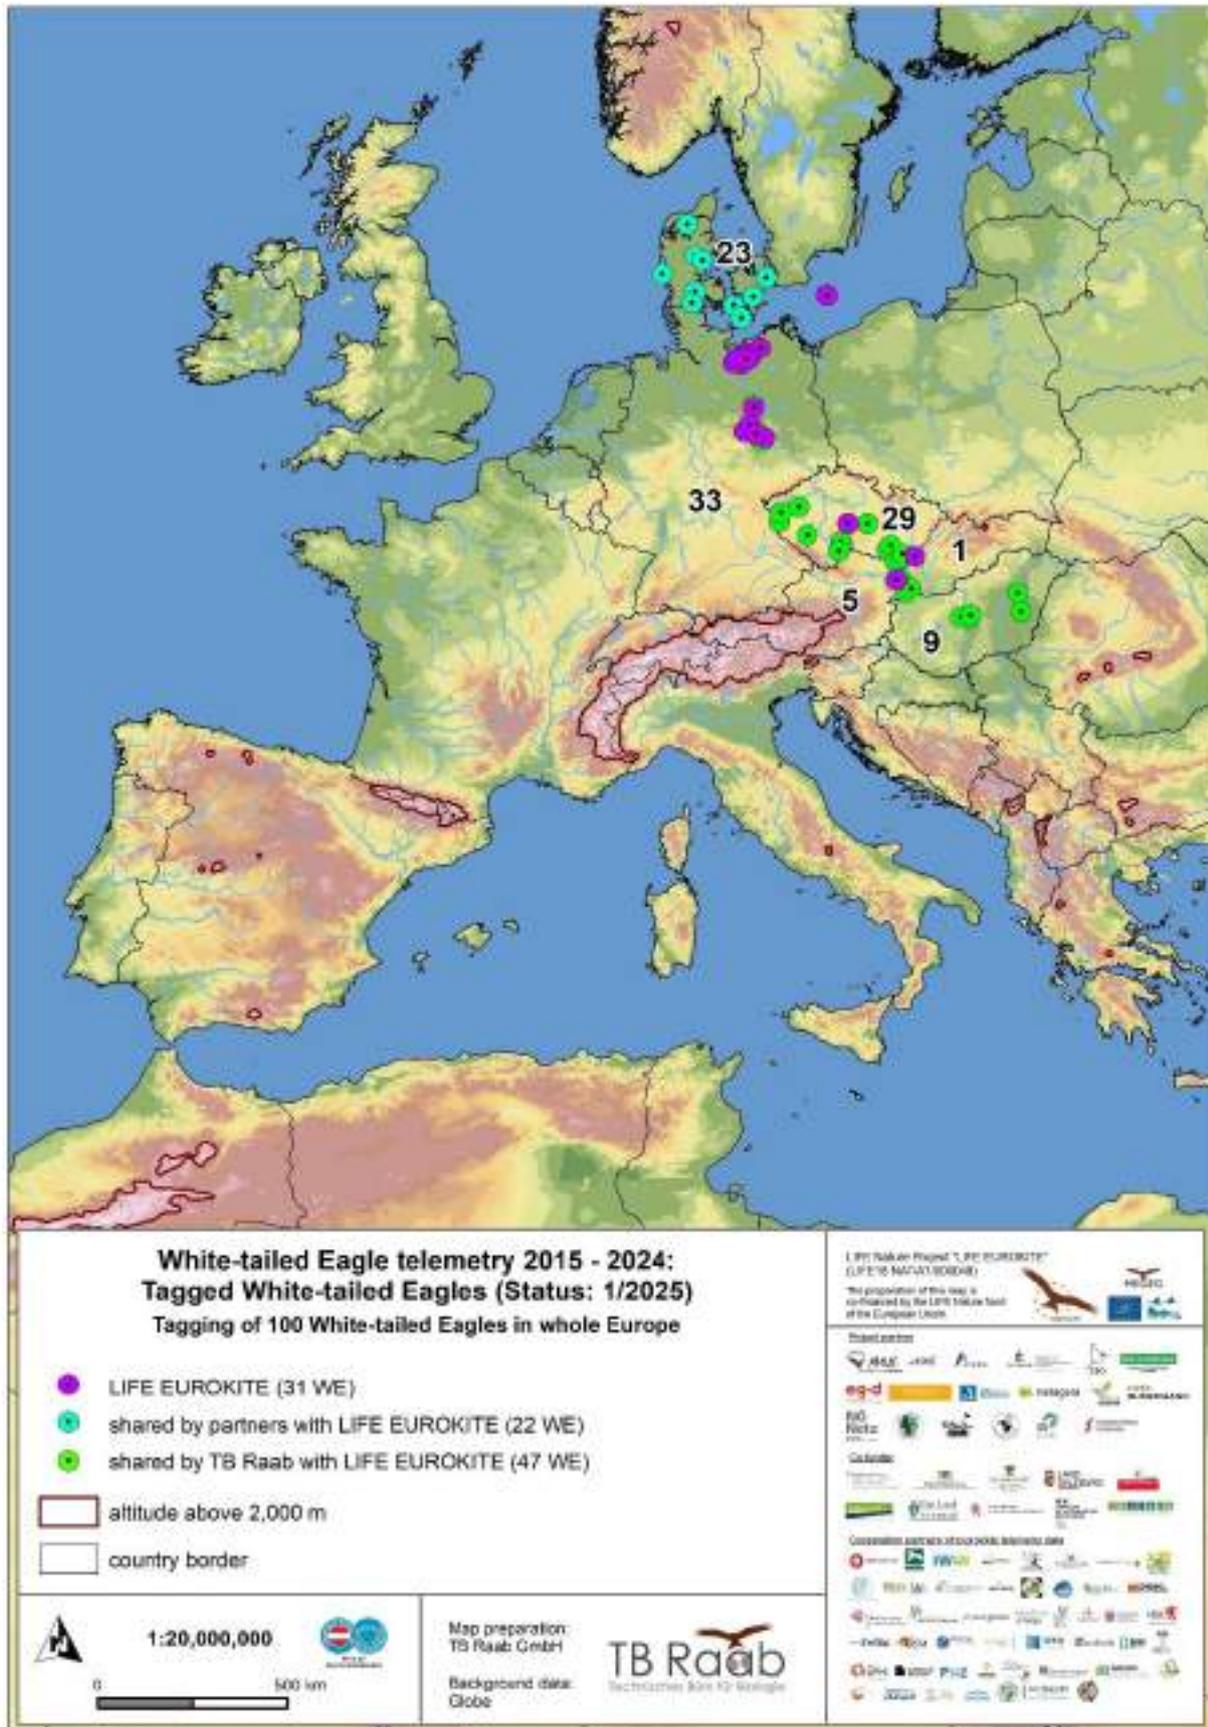

Figure 7: Tagging of 100 white-tailed eagles by the LIFE EUROKITE project and numerous cooperation and project partners across Europe the years 2015-2024.

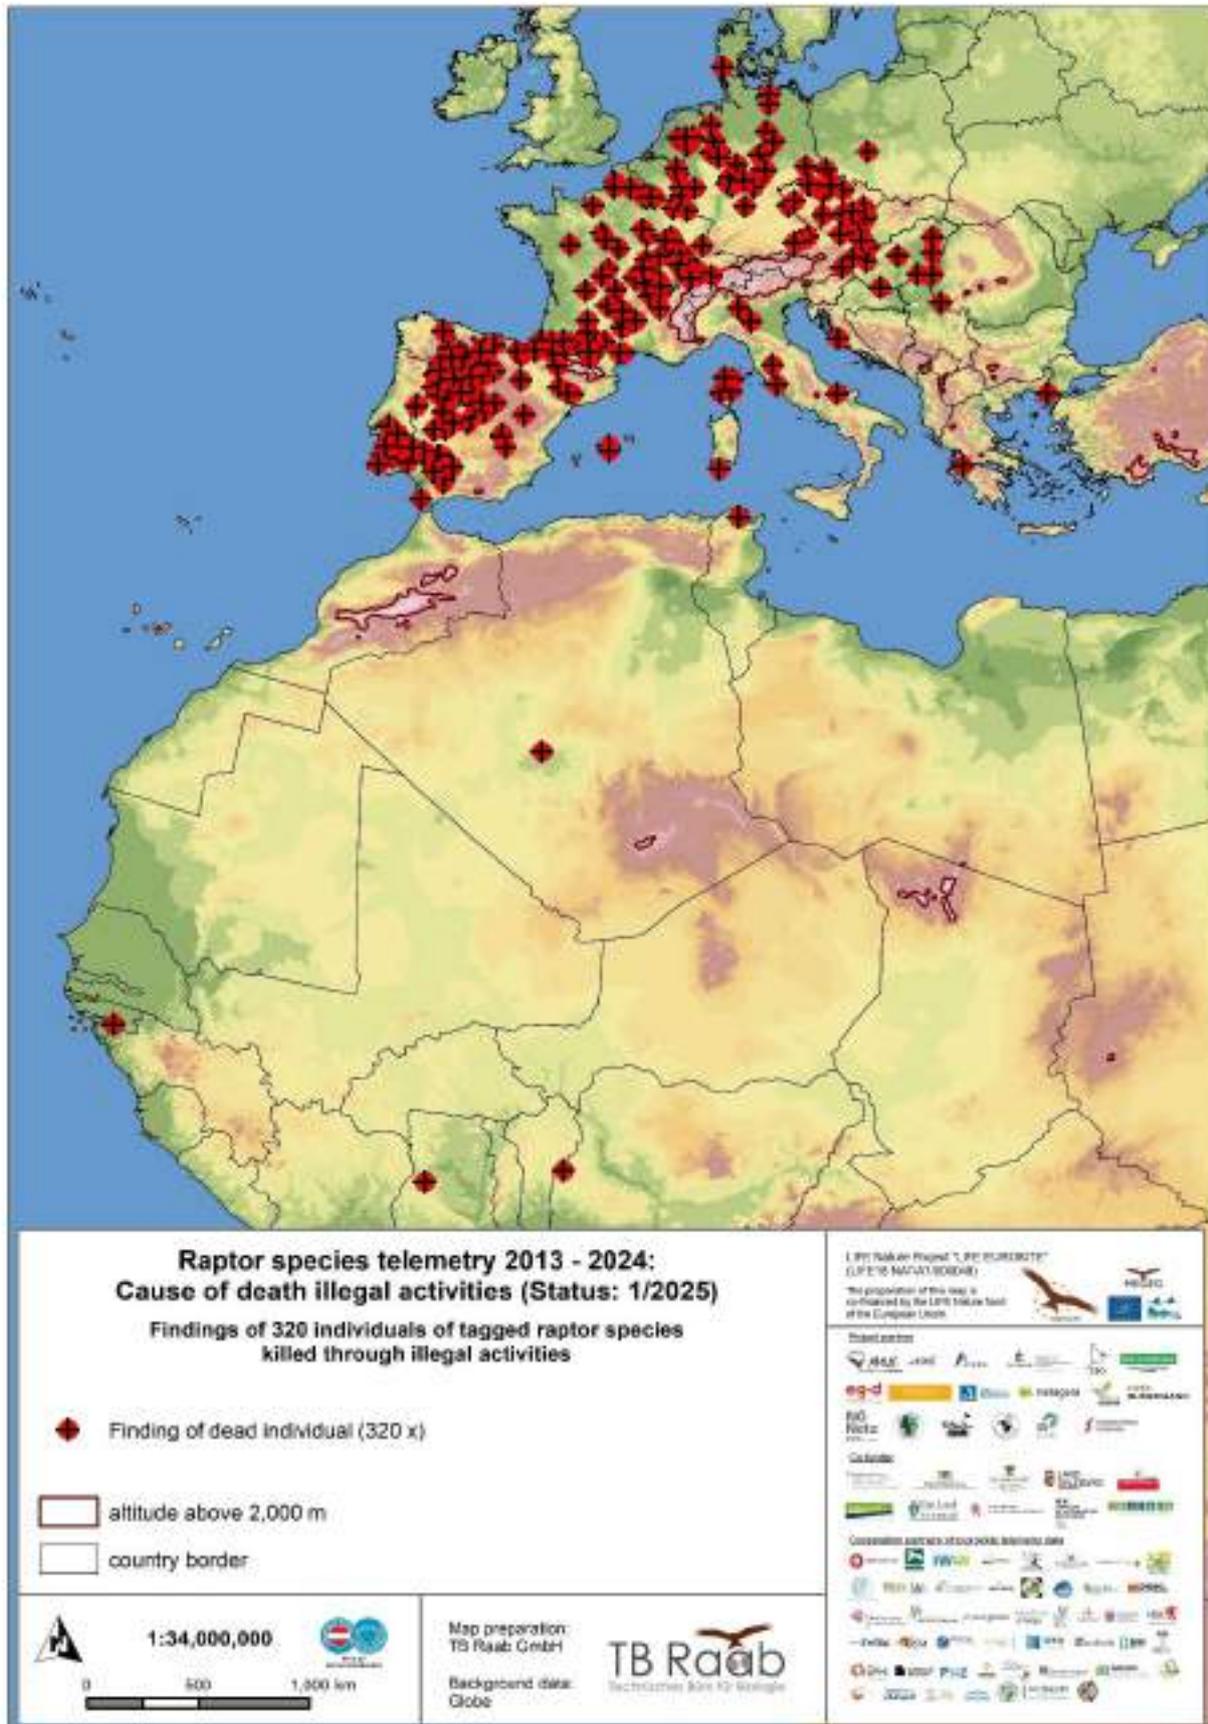

Figure 8: Interim results of 320 tagged birds which died due to illegal activities in the years 2013 to 2024 across Europe.

3 Spanish results

The subsequent section provides a detailed overview of the cases with illegal mortality reasons in Spain. A total of 82 birds have been confirmed as victims of illegal activities. Most of the tagged individuals were victims of poisoning (57), followed by shooting (18), bird crime (4), secondary poisoning (2) and trapping (1).

3.1 Tagged individuals that have been poisoned

The birds are listed in chronological order by date of bird crime, commencing with the first recorded case.

RK_1976

General information about the bird

Name: BECERRIL

Species: Red kite

Birth date: 22.04.2014

Place of tagging: Becerril, Madrid, Spain

Date of tagging: 11.06.2014

Age at tagging: 1. CY

Origin of bird: Juvenile from the nest

Ownership category: C_GREFA

Logger number: 48511699469

Ring number: B[UHR]

Sex: Male

Bird crime information

Place of bird crime: Córdoba, Andalucía, Spain

Coordinates: 37,8286500, -4,7587830

Date of bird crime: 24.03.2015, 12:00:00 PM (UTC)

Age at bird crime (Days): 336

Age at bird crime: 2. CY

Responsible organization for the investigation: GREFA

Logger and/or bird found: No information about logger and bird

Carcass state: -

Bird crime: Poisoning

Certainty category: Certain

Ring number: H64201

Sex: Female

Bird crime information

Place of bird crime: Valdehúncar, Extremadura, Spain

Coordinates: 39.820691, -5.520779

Date of bird crime: 17.08.2022, 10:23:09 PM (UTC)

Age at bird crime (Days): 117

Age at bird crime: 1. CY

Responsible organization for the investigation: SEO/BirdLife

Logger and/or bird found: Logger found, no information about the bird

Carcass state: -

Bird crime: Poisoning

Certainty category: Probable

Additional information: Expert assessment (TB Raab). The bird arrived near the site of the bird crime on 15 August 2022 at approximately 18:43 UTC and did not move away. Until 16 August 2022, 13:00 UTC, the bird was still alive but showed very little movement. This suggests a possible poisoning, as the bird appeared to die slowly.

Age at bird crime (Days): 144

Age at bird crime: 1. CY

Responsible organization for the investigation: Privat person/ Pennatus Association

Logger and/or bird found: Logger and bird not found

Carcass state: -

Bird crime: Shooting

Certainty category: Possible

Additional information: Expert assessment (Privat person/Pennatus Association). The bird died at a hunting site, after which the hunter moved it to another location and subsequently to a house. This sequence of events suggests that the bird may have been shot; however, the police and the judge ultimately had to close the case, as the bird was not recovered and no further action could be taken.

Investigation information

Last modification: 08.01.2025

Investigation: Stopped

Police and/or authority investigation: Police and authority informed → Stopped

Legal proceeding: Yes → Stopped

Conviction: No

If investigation stopped or no conviction was achieved, why?

Bird was not found at the house. If new evidence emerges, the case will be reopened.

Date of bird crime: 08.09.2022, 01:45:00 PM (UTC)

Age at bird crime (Days): 139

Age at bird crime: 1. CY

Responsible organization for the investigation: SEO/BirdLife

Logger and/or bird found: Logger and bird not found

Carcass state: -

Bird crime: Shooting

Certainty category: Certain

Additional Information: Expert assessment (SEO/BirdLife). It was assumed that the bird died as a result of human intervention on 08.09.2022 at 01:45:44 PM UTC. At 05:00:25 PM UTC, the bird was likely loaded into a vehicle and driven around, including at least three stops. This movement pattern may indicate a hunter returning from a night hunt, as the recorded stops occurred between 12:24:15 AM UTC and 05:00:34 AM UTC.

Subsequently, the transmitter remained in a barn near the location of the bird crime until 09.09.2022 at 04:00:07 PM UTC. After that, the transmitter was presumably taken to a nearby

forest and destroyed. No further signals from the logger are expected; therefore, the end of tracking was set to the last known position.

Place of bird crime: Becerril de la Sierra, Manzanares el Real, Spain

Coordinates: 40.680752, -3.852234

Date of bird crime: 07.10.2024 03:56:23 PM (UTC)

Age at bird crime (Days): 1.629

Age at bird crime: 5. CY

Responsible organization for the investigation: GREFA

Logger and/or bird found: Logger and bird found

Carcass state: Bad

Bird crime: Trapping

Certainty category: Certain

Additional information: Expert assessment (GREFA). The site was searched in October. At the last known position, traps set to kill predators were found. The environmental authority was informed and reportedly identified the perpetrator. Despite efforts, including the use of trained dogs, the red kite did not appear. In January 2025, the transmitter started sending data again, and

the carcass of the kite was found. It was decomposed but still had wings and head, while the legs were missing, consistent with it having been placed there by the environmental offenders. The case is currently in court, and the alleged perpetrator has already been questioned by the prosecutor.

Origin of bird: Juvenile from the nest

Ownership category: B_MEGEG (ENERTRAG)

Logger number: ANITRA 149 - 20461

Ring number: EA226056

Sex: Female

Bird crime information

Place of bird crime: Calle la Parrilla, Castilla y León, Spain

Coordinates: 41.535728, -4.487781

Date of bird crime: 20.01.2021, 09:54:44 AM (UTC)

Age at bird crime (Days): 255

Age at bird crime: 2. CY

Responsible organization for the investigation: SEO/BirdLife

Logger and/or bird found: Logger found, bird not found

Carcass state: -

Bird crime: Bird crime

Certainty category: Certain

Additional information: Expert assessment (SEO/BirdLife). The bird was killed intentionally by a person. The transmitter was removed 10 minutes after the kill at latest and then moved by car

and thrown in the garbage. The bird was hidden or disposed of in another place that could not be located.

Investigation information

Last editing: 08.01.2025

Investigation: No information received

Police and/or authority investigation: Police and authority informed → No further information received

Legal proceeding: No information received

Conviction: No information received

If investigation stopped or no conviction was achieved, why?

No information received

RK_0454

General information about the bird

Name: Zepkow_01

Species: Red kite

Birth date: 10.05.2020

Place of tagging: Zepkow, Mecklenburg-Western Pomerania, Germany

Date of tagging: 18.06.2020

Age at tagging: 1. CY

Origin of bird: Juvenile from the nest

Ownership category: B_MEGEG (ENERTRAG)

Logger number: ANITRA 154 - 20468

Ring number: EA226052

Sex: Male

Bird crime information

Place of bird crime: Dueñas, Castilla y León, Spain

Coordinates: 41.895996, -4.521965

Date of bird crime: 29.11.2022, 09:54:44 AM (UTC)

Age at bird crime (Days): 255

Age at bird crime: 3. CY

Responsible organization for the investigation: SEO/BirdLife

Logger and/or bird found: Logger and bird not found

Carcass state: -

Bird crime: Bird crime

Certainty category: Probable

Additional information: Expert assessment (TB Raab). The last three positions recorded by the logger were all on the street, as if the bird were being transported in a vehicle, just before the tag stopped sending data. This pattern is highly suspicious for illegal shooting and subsequent transport.

3.7 Summary of the Spanish results

Please note, that due to different number of tagged birds per countries and especially the different density of red kites per country the results can differ significant per country. Therefore, these results do not provide any information about the statistical frequencies of illegal activities in the respective country.

The interim results of the LIFE EUROKITE (LIFE18 NAT/AT/000048) project 2020-2024 with additional results from 2013 onwards show, that 511 tagged raptors died in Spain. Of those, 82 individuals (80 red kites, 1 black kite and 1 booted eagle) died due to illegal activities. Most of the tagged individuals (57) died due to poisoning, followed by shooting (18), secondary poisoning (2) and trapping (1). For 4 individuals the exact cause of death (poisoning, shooting, trapping) could not be determined during the examination of the dead bird (Table 1 to Table 2 & Figure 276).

Table 1: Overview of the numbers of tagged birds which died due to bird crime in Spain.

Mortality reason	Booted eagle	Black kite	Red kite	Total
Bird crime	-	-	4	4
Bird crime - Shooting	1	1	16	18
Bird crime - Trapping	-	-	1	1
Bird crime - Poisoning	-	-	57	57
Bird crime – Secondary poisoning	-	-	2	2
Total	1	1	80	82

Table 2: Overview of the districts where tagged birds died due to bird crime in Spain.

Federal State	Bird crime					Total
	Bird crime	Shooting	Trapping	Poisoning	Secondary Poisoning	
Andalusia (Andalucía)	1	2	-	4	-	7
Aragon (Aragón)	-	2	-	1	-	3
Asturias	-	-	-	1	-	1

Total	4	18	1	57	2	82

Detected substances

Out of the poisoned birds that died in Spain, 10 different substances were detected in 15 toxicologically analysed birds. Aldicarb has been detected in 3 birds. Carbofuran, Brodifacoum and Bromadiolone have been detected in 2 birds each. Chlorpyrifos, Difenacoum, Oxamyl, and Pentobarbital were each found once. One bird has visited landfills, where it may have been exposed to potentially harmful substances (**Fehler! Verweisquelle konnte nicht gefunden werden.**). Out of the 59 poisoned birds, 44 birds were either not toxicologically analysed, or the detected substance was categorised as unknown.

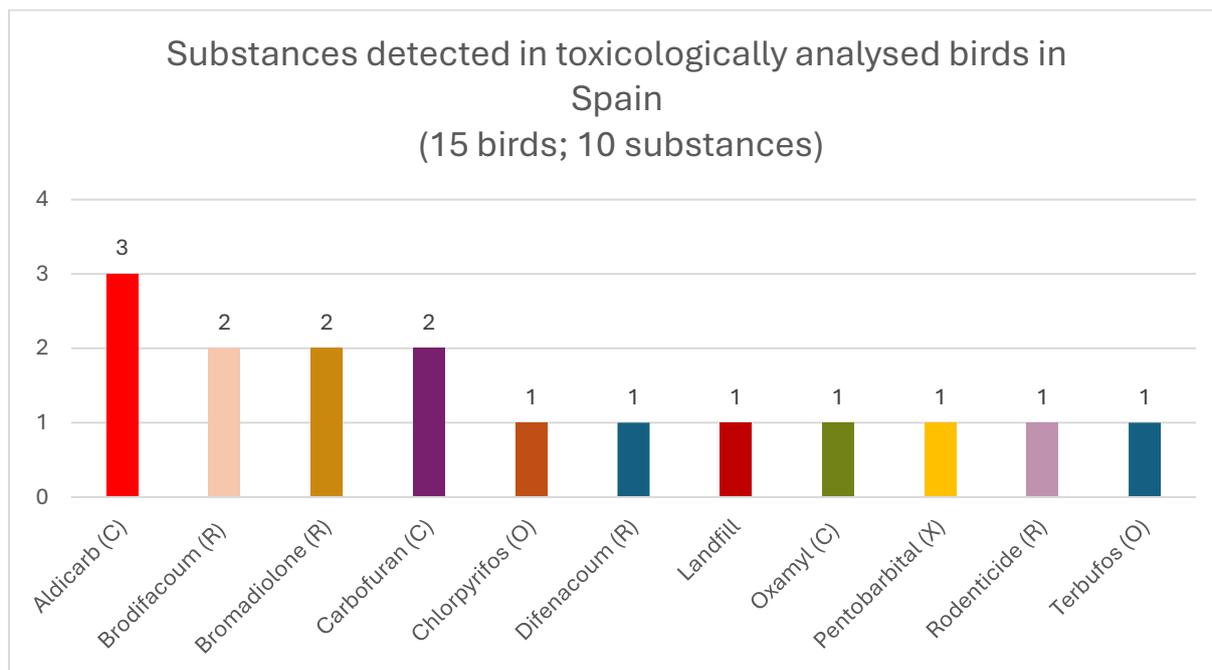

Figure 273: Substances detected (10 substances) in poisoned birds in Spain (15 toxicologically analysed birds with detected substances). In total, 59 birds were classified as poisoned based on field evidence and GPS data. Toxicological analyses were available for 15 individuals. Most birds had more than one toxin in their bodies, but not all detected toxins were the direct cause of death. In two cases, exposure could only be confirmed at the level of the carbamate/rodenticide substance group, as the specific compound had not been analytically identified. Detected substances are classified into the following chemical groups: (C) Carbamates, (R) Rodenticides, (O) Organophosphates and (X) Other substances.

Toxicological analyses of poisoned birds revealed the presence of 10 active substances, including a range of pesticides, rodenticides, organosphates and veterinary drugs. Among the compounds identified were Carbamate insecticides such as Aldicarb, Carbofuran and Oxamyl, rodenticides such as Brodifacoum, Bromadiolone, Difenacoum, as well as organophosphates like Chlorpyrifos and Terbufos. Other substances like Pentobarbital have also been detected. Most of these substances are not approved for use under current European legislation (European Parliament and Council of the European Union, 2009) (Table 3).

The use of the toxic substances Pentobarbital (European Community Number 200-983-8) is approved within the European Union. Under Regulation (EU) 528/2012 (BPR), the detected rodenticides (Brodifacoum, Bromadiolone and Difencaoum) are approved as active substances, even though they are strictly regulated (European Parliament and Council of the European Union, 2012).

Table 3: Regulatory status and legal framework of not approved toxic substances detected in poisoned raptors tagged in the LIFE EUROKITE project (2013–2024) according to Regulation (EC) No 1107/2009 of the European Parliament and Council.

Substance	Status	Regulation	Legislation
Aldicarb	Not approved	Reg. (EC) No 1107/2009 (repealing Directive 91/414/EEC)	2003/199/EC
Carbofuran	Not approved	Reg. (EC) No 1107/2009 (repealing Directive 91/414/EEC)	Reg. (EU) 2007/416
Chlorpyrifos	Not approved	Reg. (EC) No 1107/2009 (repealing Directive 91/414/EEC)	Reg. (EU) 2020/18
Oxamyl	Not approved	Reg. (EC) No 1107/2009 (repealing Directive 91/414/EEC)	Reg. (EU) 2023/741, Dir 06/16/EC, Reg. (EU) No 540/2011
Terbufos	Not approved	Reg. (EC) No 1107/2009 (repealing Directive 91/414/EEC)	2002/2076

Substances confirmed as lethal

As mentioned above, most birds contained more than one toxic substance; however, not all detected toxins were identified as the direct cause of death. Toxicological analyses confirmed the presence of toxic substances in 15 birds (including 2 secondary poisoned birds), whereas in 44 cases poisoning was suspected but the responsible substance remained unknown. To determine which substances were lethal, 13 individuals were analysed (excluding the 2 cases of secondary poisoning out of the 15 toxicologically analysed birds). In 11 of these birds, toxicological threshold values were exceeded, allowing the lethal substance to be clearly identified. In 2 cases, the lethal substance could not be clearly identified. This occurred, for example, when multiple toxic substances were detected in a single individual and several toxicological threshold values were exceeded. As it could not be conclusively determined whether secondary poisoned birds (2 cases) died indirectly from toxic exposure, these cases were not included in the figure (Figure 274).

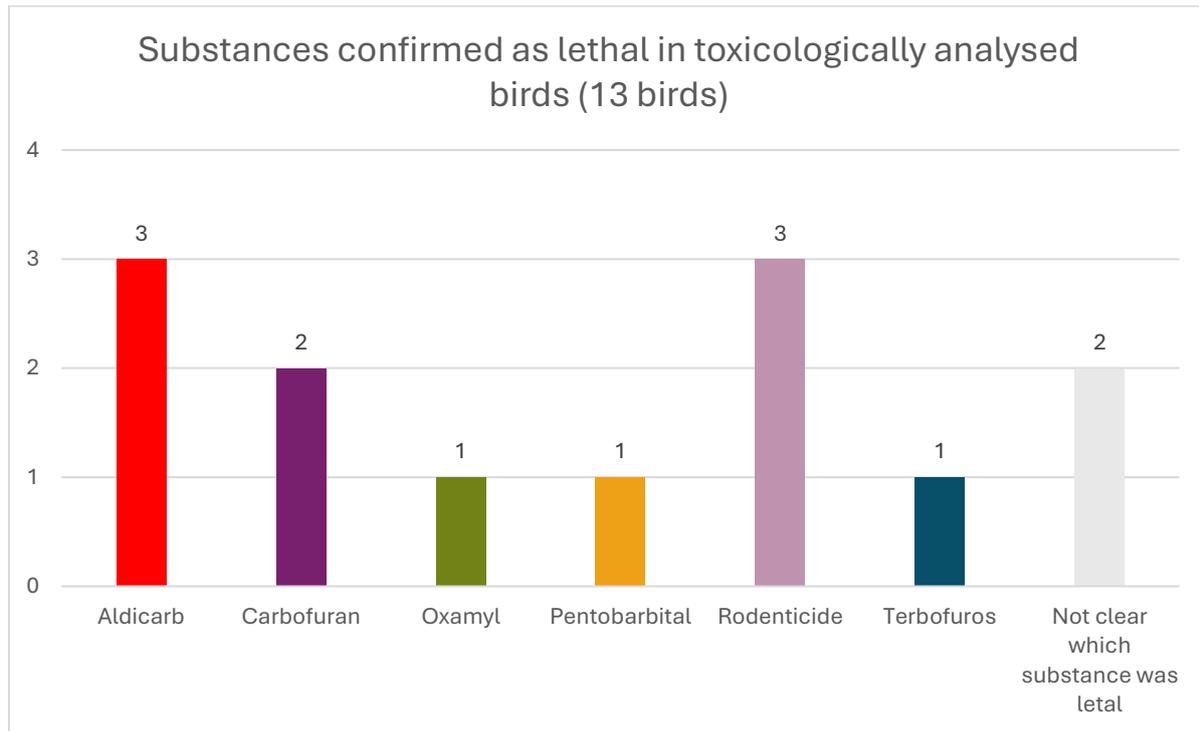

Figure 274: Toxic substances confirmed as lethal (6 substances) in poisoned birds. In total, 59 birds were classified as poisoned based on field evidence and GPS data, including 2 secondary poisoning cases. Toxicological analyses detected substances in 15 birds, of which 13 individuals (excluding secondary poisoned birds) were confirmed to have died as a result of poisoning. In 11 of these birds, toxicological threshold values allowed the lethal substance to be clearly identified, while in the remaining 2 cases the lethal compound could not be determined because multiple substances exceeded toxicological thresholds. Most birds carried more than one toxic substance.

It should be noted that many birds were exposed to rodenticides, which were often detected at sublethal concentrations. While these doses were not immediately lethal, rodenticides can accumulate over time and may either directly cause mortality or progressively impair physiological functions, leading to long-term health effects.

Assessment of intentional poisoning

Poisoning cases were evaluated using toxicological findings together with field observations. Birds were classified as intentionally poisoned when evidence clearly indicated deliberate poisoning, such as detection of substances banned in the European Union, discovery of poisoned bait near the carcass, the presence of multiple dead birds at the same site or when the perpetrator had been identified. When available evidence did not allow a clear determination of intentional poisoning, cases were classified as undefined. This group includes birds exposed to substances that are legally permitted in the EU (e.g. rodenticides, metaldehyde or cadmium), cases of secondary poisoning, birds recovered from landfill sites, and birds without toxicological examination. It also covers cases in which a detected substance was banned at the time of analysis but remained legally authorised when the poisoning event occurred. Overall, 6 of the 59 poisoned birds were classified as intentional poisoning cases, while 53 cases remained undefined (Figure 275: Number of poisoned birds classified as confirmed intentional poisoning or as cases with undetermined intent. Confirmed intentional poisoning includes cases involving toxic substances prohibited in the European Union, the presence of poisoned bait, multiple birds found dead at the same site or instances where the

perpetrator has been identified. Cases with undetermined intent include birds exposed to legally permitted substances, secondary poisoning, landfill-related cases, or birds without toxicological analysis. Of the 59 poisoned birds in Spain, 6 were classified as confirmed intentional poisoning and 6 as cases with undetermined intent. Figure 275).

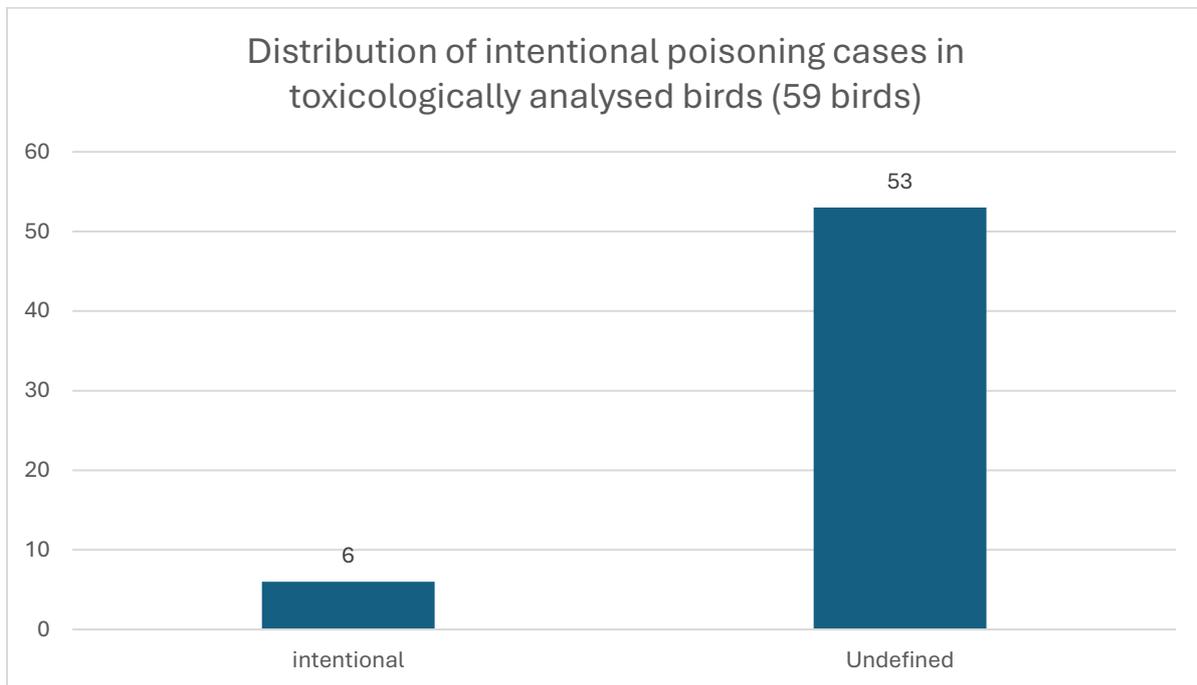

Figure 275: Number of poisoned birds classified as confirmed intentional poisoning or as cases with undetermined intent. Confirmed intentional poisoning includes cases involving toxic substances prohibited in the European Union, the presence of poisoned bait, multiple birds found dead at the same site or instances where the perpetrator has been identified. Cases with undetermined intent include birds exposed to legally permitted substances, secondary poisoning, landfill-related cases, or birds without toxicological analysis. Of the 59 poisoned birds in Spain, 6 were classified as confirmed intentional poisoning and 6 as cases with undetermined intent.

Results of the investigation

In 24 cases, the authority was informed. In 2 cases, neither the police nor any authority were informed. In 15 cases, both the police and the authority were informed. For 41 cases, no information was received regarding the reporting status (Table 4).

Table 4: Overview of Spanish reporting of bird crimes to the police/authorities

Reporting to the police/authority	
Neither police nor authority informed	2
Authorities informed	24
Police and authority informed	15
No information received	41
Total	82

Regarding the investigation status, 2 cases had no investigation. In 8 cases, the investigation is ongoing, and 5 cases had the investigation stopped. For 67 cases, no information was received about the investigation status. For the legal proceeding status, 4 cases had no legal proceedings initiated. In 4 cases, the legal proceedings are pending, and in 4 cases, the legal proceedings are ongoing. 3 cases had the legal proceedings stopped. Additionally, in 67 cases, no information was received regarding the legal proceedings (Table 5).

Table 5: Overview of the status of Spanish investigation and prosecution measures for bird crime

	Investigation status	Prosecution status
No investigation/prosecution	2	4
Ongoing	8	4
Pending	-	4
Stopped	5	3
Completed	-	-
No information received	67	67
Total	82	82

In terms of conviction, 7 cases resulted in no conviction, and 8 cases are not yet convicted. For 67 cases, no information was received regarding the conviction status (Table 6).

Table 6: Overview of the conviction status

Conviction	
No conviction	7
Not yet	8
Convicted	-
No information received	65
Total	82

The reasons for no conviction include 8 cases where the legal proceedings are still ongoing (1 of these cases is a secondary poisoned bird). In 2 cases, neither the police nor the authority were informed. Additionally, in 1 case, secondary poisoning was identified as a factor which is why the prosecution stopped, and in 1 case, the reason for no conviction was due to too little evidence. In 70 cases, no information was received regarding the reason for the lack of conviction (Table 7).

Table 7: Overview of the reasons, why there was no conviction of the bird crimes

Reason for no conviction	
Neither police nor authority informed	2
Too little evidence	1
Secondary poisoning	1
Legal proceeding ongoing	8
No information received	70
Total	82
